20 **Abstract**

1 **Purpose-** There is a general inquisition regarding the monetary value of a research output, as
2 a substantial amount of funding in modern academia is essentially awarded to good research
3 presented in the form of journal articles, conferences papers, performances, compositions,
4 exhibitions, books and book chapters etc., which, eventually leads to another question if the
5 value varies across different disciplines. Answers to these questions will not only assist
6 academics and researchers, but will also help higher education institutions (HEIs) make
7 informed decisions in their administrative and research policies.

8 **Design & Methodology-** To examine both the questions, we applied the United Kingdom's
9 recently concluded national research assessment exercise known as the Research Excellence
10 Framework (REF) 2014 as a case study. All the data for this study is sourced from the openly
11 available publications which arose from the digital repositories of REF's results and
12 HEFCE's funding allocations.

13 **Findings-** A world leading output earns between £7504 and £14,639 per year within the REF
14 cycle, whereas an internationally excellent output earns between £1876 and £3659, varying
15 according to their area of research. Secondly, an investigation into the impact rating of 25315
16 journal articles submitted in five areas of research by UK HEIs and their awarded funding
17 revealed a linear relationship between the percentage of quartile-one journal publications and
18 percentage of 4* outputs in Clinical Medicine, Physics and
19 Psychology/Psychiatry/Neuroscience UoAs, and no relationship was found in the Classics
20 and Anthropology/Development Studies UoAs, due to the fact that most publications in the
21 latter two disciplines are not journal articles.

22 **Practical implications-** The findings provide an indication of the monetary value of a
23 research output, from the perspectives of government funding for research, and also what
24 makes a good output, i.e. whether a relationship exists between good quality output and the
25 source of its publication. The findings may also influence future REF submission strategies in
26 HEIs and ascertain that the impact rating of the journals is not necessarily a reflection of the
27 quality of research in every discipline, and this may have a significant influence on the future
28 of scholarly communications in general.

29 **Originality-** According to the author's knowledge, this is the first time an investigation has
30 estimated the monetary value of a good research output.

31 **Keywords**

1 REF 2014, research quality, research evaluation, impact factor, research funding, university
2 research

3 **1. Introduction**

4 Research is evaluated in several forms and despite years of debate to find an effective and
5 efficient method, the academic community is yet to reach a consensus. Peer review has been
6 the oldest form of research evaluation and stands firm in spite of several disputes surrounding
7 its functioning. Several databases and metrics such as Web of Science, Scopus, Scholar,
8 InCites, SciVal, h-index and Altmetrics attempt to establish the quality of research through
9 publication profile and citation profile or both [1-3]. However, these measures remain
10 questionable due to the narrow interpretations they produce and are often confined to
11 academic evaluation [4-6]. Consequently, some alternative approaches such as the Web-
12 impact metrics, societal impact, and a combination of principles such as the Leiden Manifesto
13 were proposed [1, 2, 7]. Funding good research is essential for the survival of science, and
14 progressive countries, invest between 2% to 3% of their gross domestic product on research
15 and development activities, a good portion concentrated in Higher Educations Institutions
16 (HEIs), which has proven to be extremely beneficial for multiple societal aspects [8].
17 However, two fundamental questions still remain unanswered, viz. (1) what is the economic
18 value of a research output, as perceived by governments or agencies that fund research, and
19 (2) what makes a good research output, and more specifically is there a direct relationship
20 between the quality of a research output, as determined through its monetary value, and the
21 source of its publication This study aims to address the following questions:

22 i. What is the monetary value of an output showcasing good research?

23 ii. Does the value vary amongst different disciplines?

- 1 iii. Is there a relationship between the value of a research output and the reputation of its
2 publication source; and
- 3 iv. Can the assigned value of a research output alter the nature of science and research in a
4 country?

5 The recently concluded national research evaluation exercise in UK, called REF2014, has
6 been used as a case study to find answers to these questions.

7 *1.1 UK Universities*

8 Like in any other countries, HEIs play an essential role in UK society. According to a latest
9 Universities UK report, the UK HE sector contributed £39.9 billion, equivalent to 2.8% of the
10 UK's gross domestic product (GDP), and employed 757, 268 individuals in 2011 [9].
11 According to the Higher Education Statistics Agency (HESA), a typical UK HEI's revenue
12 break-down is as follows: 35% tuition fee, 30% funding council grants, 16% research grants
13 and contracts, 1% from endowments/ investment income, and 18% from other sources i.e.
14 alumni donations etc. [10]. Visibly, a large portion of revenue for the HEIs come from the
15 funding councils, which generally award the funding based on performance, thus making
16 research evaluation and the financial returns of research conducted an important question for
17 academia to inquire. Considering the recently concluded Research Excellence Framework
18 (REF) 2014, the UK's national research assessment exercise, as a case study offers a chance
19 to answer the question and also an opportunity for other research intensive countries to
20 compare their performance-based research funding. It may be argued that the amount of
21 money available to distribute to the HEIs is very much dependent on the available budget for
22 a particular government, and hence the monetary value of the research outputs will not
23 provide us a definitive figure, and therefore may not be applicable to others. However, since
24 the REF 2014 is a national exercise, and it determines the annual funding for research for all

1 the HEIs, and all the HEI staff in the country, for six to seven years (until a similar exercise,
2 or an alternative, takes place), it has an impact on the research and scholarly activities of the
3 entire country for several years. Hence, we decided to use the REF2014 datasets to find
4 answers to the research questions mentioned earlier.

5 *1.2 What is the REF 2014?*

6 The REF 2014 was a research evaluation exercise conducted by a combined team of
7 organisations, namely the Higher Education Funding Council for England (HEFCE) and
8 Wales (HEFCW), the Scottish Funding Council (SFC) and the Department for Employment
9 and Learning (DEL) of Northern Ireland to measure the quality of research at various HEIs in
10 the United Kingdom [11]. It is a performance-based HEI research funding system whose
11 results inform the higher education funding bodies to allocate funding each year to HEIs
12 based on their performance [7]. It also plays a vital role in an HEI's ability to secure funding
13 from other sources, league table scores, reputation and attracting talent in terms of students
14 and academics [12].

15 The results from the current REF assisted in the yearly disbursement of £1.6 billion per year to
16 UK based higher education and research institutions until the next such exercise, possibly
17 commissioned for 2021. The results of REF 2014 led to drastic alterations in funding
18 allocations when compared to the previous REF (RAE 2008). An HEI lost about 17.1%
19 (£14.2 million) of its funding and in another exceptional case, an HEI lost 45% of its funding.
20 The maximum gain by any HEI stood at 12.4% (£7.1 million) [13, 14]. The repercussions of
21 such fluctuations are considerable to the future of research at UK HEIs.

22 To submit for the REF, the HEIs had to choose the areas of research (called Units of
23 Assessment/ UoAs) out of the available 36 UoAs, which they wished to be evaluated upon
24 and prepared their submission in a prescribed format. The submissions for the REF 2014

1 were evaluated by 1052 individuals, of which 77% were academics and 23% were users
2 (individuals who apply HEI research and collaborators outside academia), under the guidance
3 of 36 expert sub-panel chairs, additionally supported by four main panel chairs to evaluate
4 and determine the quality of research. Research was adjudged into five categories; 4* (world
5 leading), 3* (internationally excellent), 2* (recognised internationally), 1* (recognised
6 nationally) and unclassified (REF, 2014). The overall quality of research was assessed
7 through a combination of quality of research outputs (65% weightage) in terms of rigour,
8 originality and significance; 'impact' of research (20% weightage), a new factor introduced
9 in REF evaluation, assessing the 'reach and significance' of research on multiple societal
10 factors; and research environment (15% weightage), in terms of 'vitality and sustainability'
11 i.e. PhD completions, laboratory facilities and wider disciplinary contributions [11].

12 *1.3 Research Outputs*

13 HEIs submitted various types of research outputs for evaluation i.e. journal and conference
14 articles, books, book chapters, edited books, patents, design, artefacts, software, exhibitions
15 and compositions etc. The submitted outputs were evaluated and graded into five categories
16 as previously mentioned. However, only 4* (world leading) and 3* (internationally excellent)
17 outputs were eligible for funding and the final weightage, fairly taking into account the
18 number of staff members who had submitted for the UoA from the HEI, thus minimising
19 quantitative bias. Finally, funding is allocated based on the weightage acquired by the HEIs,
20 which is a sum of the number of 3* outputs and four times the number of 4* outputs.
21 According to HEFCE's pre-submission guidelines, 4* outputs received four times higher
22 funding than 3* outputs and the allocation of funding varied across disciplines as research
23 expenses vary in different research disciplines (for example, laboratory-based research incurs
24 higher expenses than library-based research). Post-REF 2014 data reveals that research
25 outputs alone led to a total allocation of £661.3 million Pounds in research money to UK

1 HEIs per year, not considering the ‘London weighting’ which was exclusively granted to
2 HEIs located in London due to higher costs associated with the capital.

3 *1.4 Evaluation of quality of the output*

4 According to HEFCE, the outputs were evaluated upon their ‘originality, significance and
5 rigour’ in comparison to international standards [11, 15]. HEFCE advised HEIs against
6 choosing outputs with high citation indices for submission, rather select outputs which the
7 HEIs affirm as high quality. However, in some cases, the citation data of outputs and
8 significance of outputs beyond academia were considered as indicators of quality by the sub-
9 panels [15].

10 **2. Methods**

11 Six HEIs were randomly chosen from each of the 36 UoAs of the REF. The HEIs’ percentage
12 of 4* (X) and 3* (Y) research outputs was noted from the REF’s results, in addition to
13 considering the staff count (A) of each HEI. This allowed the calculation of the number of 4*
14 (B) and 3* (C) outputs considered for weightage (W).

$$15 \quad B = (X/100)*A ; C = (Y/100)*A$$

16 Weightage (W) was calculated as the sum of four times the number of 4* and 3* research
17 outputs.

$$18 \quad W = (B*4) + C$$

19 The total funding awarded (FA) for each HEI under each UoA was noted from HEFCE’s
20 funding allocation [table](#). Assuming all outputs to be rated 4*, the value of each 4* output (F)
21 is obtained by dividing the total funding award (FA) by the weightage (W).

$$22 \quad F = FA/W$$

1 According to the HEFCE, the value of each 4* output is four times the value of each 3*
2 output. Hence, the value of each 3* output (T) is obtained by dividing the value of each 4*
3 output (F) by 4.

$$4 \quad T = F/4$$

5 *2.1 Example of the calculation*

6 For clarity of the above calculation, let us consider the case of the University of Cambridge
7 under the General Engineering UoA. 37.4% (X) of its research was rated 4* and 55.8% (Y)
8 was rated 3* with a staff count of 177.20 (A) FTE. It received £5,328,295 (FA) from HEFCE
9 for its outputs performance in General Engineering. The number of 4* (B) and 3* (C) outputs
10 considered for weightage (W) can be obtained as follows

$$11 \quad B = (37.4/100) * 177.2 = 66.27 ; C = (55.8/100) * 177.2 = 98.88$$

12 Thus weightage is obtained by the sum of four times the number of 4* and the number of 3*
13 outputs. $W = (4 * 66.27) + 98.88 = 363.97$

14 Assuming all outputs were awarded a 4* rating, the value of each 4* output (F) is obtained by
15 dividing the total funding received (FA) by the weightage (W). As 4* outputs are four times
16 the value of 3* outputs, the value of each 3* (T) output is obtained by dividing the value of
17 each 4* output by 4.

$$18 \quad F = £5328295 / 363.97 = £14639.38 ; T = £14639.38 / 4 = £3659.84$$

19 At this point, it is important to understand REF's instructions. The REF required each staff
20 member considered for submission to submit four outputs each [15]. Cambridge for the
21 General Engineering UoA presented 177.20 FTE staff and submitted 616 outputs. Ideally,
22 Cambridge should have submitted 708.8 (No. of staff submitted multiplied by 4). However

1 due to specific circumstances (i.e. career breaks, early career researchers etc.) submitted 616
2 outputs for evaluation. The REF is aware of such circumstances and is considerate by not
3 penalising the HEI, taking into account the phase of a researcher's career and personal
4 circumstances. The REF further calculates the rating based on the ideal number of
5 submissions, but not the actual number of submissions. In the case of Cambridge, 37.4% of
6 the ideal 708.8 were rated 4* and 55.8% of the ideal 708.8 were rated 3*, which takes the
7 number of 4* submissions to 265.09 and the number of 3* submissions to 395.51.

8 So, the total funding for outputs in the General Engineering UoA for Cambridge was

$$9 \quad (265.09 * 1439.43) + (395 * 3659.86) = \text{£ } 5328295$$

10 By multiplying the number of 4* and 3* submissions with their respective value and adding
11 them up will give us the final amount of funding acquired by Cambridge. In other words, if
12 every member of Cambridge staff had to submit 4 outputs they would get the same amount of
13 money that they have received with lower number of output (616 as opposed to 709) because
14 of specific staff circumstances. This not only is a simplified explanation of the REF's
15 working, it also corroborates our calculations about the value of each 4* and 3* output.

16 *2.2 Design to observe relationship between funding awarded and publication source of the* 17 *outputs*

18 As it was impossible to identify the REF rating of an individual output, we performed an
19 indirect measure by investigating the proportion of HEIs submitted outputs published in
20 quartile-one (Q1) journals and its relationship to funding acquired. We decided to find out
21 whether any direct relation existed between the monetary value of an output and the
22 reputation of its source of publication as measured through journal impact factor.

1 Five REF UoAs; clinical medicine (Panel A, UoA 1), physics (Panel B, UoA 9),
2 psychology/psychiatry/neuroscience (Panel A, UoA 4), anthropology/development studies
3 (Panel C, UoA 24) and classics (Panel D, UoA 31) were chosen from the available 36
4 UoAs under four main panels. Each chosen UoA came under each main panel of assessment,
5 except clinical medicine and psychology/psychiatry/neuroscience which came under panel A.
6 However, since it was not possible to get the necessary data directly from the REF2014
7 results, i.e. it was not possible to find out which output got a 4* rating, we decided to use an
8 alternative approach. By using the Thompson Reuter's Journal Citation Report against the
9 submitted journal papers for each HEI in the chosen UoA, we identified how many of the
10 submitted articles were in top quartile journals, and accordingly we prepared a rank list of the
11 HEIs in a given UoA based on the number of Q1 publications. This list was plotted against
12 their percentage of 4* outputs to find any relationship.

13 All the journal articles submitted by English HEIs in each of the UoA -- 10986 for Clinical
14 Medicine; 5302 for Physics; 7484 for Psychology, Psychiatry and Neuroscience; 1198 for
15 Anthropology and Development Studies; and 345 for Classics -- a total of 25315 articles and
16 their corresponding journal's quartile score was noted through Thomson Reuter's Journal
17 Citation Reports. Quartile score is calculated for each journal in every subject category
18 according to the quarter where its impact factor falls under. Thus, a quartile 1 (Q1) journal is
19 one whose impact factor falls in the top 25% of all journals within the same subject category.
20 The quartile scores of all the journals for the year 2013 were considered for this study as the
21 quartile scores for 2014 came out in mid-2015 and the only data available for sub-panel
22 members during the REF evaluation in 2014 would have been the data from 2013. Some
23 journals cannot completely associate with a single specific subject category. In such cases the
24 nearest related subject category to the UoA was considered while noting the quartile scores.

1 Subsequently, all the journal articles submitted by the HEIs, whose journals were in the Q1
2 category were considered, allowing the calculation of all the HEIs percentage of Q1
3 publications, which was compared against percentage of 4* publications.

4 *2.3 Data*

5 All the data for this study is sourced from the openly available publications which arose from
6 the digital repositories of REF's results and HEFCE's funding allocations.

7 *2.4 Statistics and Analysis*

8 All the data for the value calculation part of the study were transferred from sources and
9 analysed using the formulas feature in MS Excel. For the next part of the study MS Excel
10 assisted in transferring the data from sources and calculation of the HEIs percentage of Q1
11 publications. Thereafter, the data was visualised using IBM's SPSS Statistics 22, in addition
12 to verifying the linear relationship between percentage of Q1 publications and funding
13 awarded per FTE staff in HEIs using a bivariate Pearson correlation test [16, 17].

14 **3. Results & Discussion**

15 *3.1 Monetary values of good research outputs in various UoAs*

16 Using the formula mentioned in the previous section, it was noted that each internationally
17 excellent output (3* in the parlance of REF2014) was awarded between £1876 and £3659,
18 whereas a world leading output (4* in the parlance of REF2014) was awarded four times the
19 award for an internationally excellent output, between £7504 and £14639, varying according
20 to the UoA (discipline). Engineering based subjects, pure and environmental sciences were
21 the highest earners; £3659 for internationally excellent and £14639 for world leading outputs.
22 Humanities, language and area studies were the lowest earners; £1879 for internationally
23 excellent and £7504 for world leading outputs. Health related subjects, clinical medicine,

1 biological and agricultural sciences received £3280 and £13123, for an internationally
 2 excellent and world leading output respectively. The financial awards for outputs in the
 3 remaining subject areas are described in Table 1. The awards for the outputs presented are for
 4 a one year period. For an entire assessment period, the outputs will fetch six times the figures
 5 stated above, realistically assuming an assessment period to be six years in the UK.

6

Table 1. Value of each 3* and 4* output in different units of assessment

Units of Assessment (UoA)	Internationally excellent £	World leading ££££
27. Area Studies 28. Modern Languages and Linguistics 29. English Language and Literature 30. History 31. Classics 32. Philosophy 33. Theology and Religious Studies 36. Communication, Cultural and media Studies/Library and Information management	1876.19- 1876.55	7504.78- 7506.22
18. Economics and Econometrics 19. Business and Management Studies 20. Law 21. Politics and International Studies 22. Social Work and Social Policy 23. Sociology 24. Anthropology and Development Studies 25. Education	2003.28- 2003.38	8013.12- 8013.55
4. Psychology, Psychiatry and Neuroscience	2273.40- 2273.44	9093.62- 9093.77
34. Art and Design: History, Practice and Theory 35. Music, Drama, Dance and Performing Arts	2439.09- 2439.13	9756.38- 9756.51
16. Architecture, Built Environment and Planning 26. Sport and Exercise Sciences, Leisure and Tourism	2604.34- 2604.35	10417.36- 10417.41
17. Geography, Environmental Studies and Archaeology	2831.70- 2831.72	11326.81- 11326.88
1. Clinical Medicine 2. Public Health, Health Services and Primary Care	3280.95- 3281.02	13123.79- 13124.06

3. Allied Health Professions, Dentistry, Nursing and Pharmacy		
5. Biological Sciences		
6. Agriculture, Veterinary and Food Science		
15. General engineering		
12. Aeronautical, Mechanical, Chemical and Manufacturing Engineering		
7. Earth Systems and Environmental Sciences		
8. Chemistry		
9. Physics	3659.81-3659.88	14639.23- 14639.52
10. Mathematical Sciences		
11. Computer Science and Informatics		
13. Electrical and Electronic Engineering, Metallurgy and Materials		
14. Civil and Construction Engineering		

1

2 The above figures, however, should not be directly used to calculate the total number of
3 outputs submitted by a specific HEI under each UoA because the number of outputs
4 submitted is weighted by the number of people who submitted. Additionally, the monetary
5 value of outputs in different disciplines should not undermine or exaggerate the value of
6 research in different disciplines. Further calculations can be found in the web-appendix MS
7 Excel spreadsheets.

8 *3.2 Does publication of research in high impact journals make it good research?*

9 This section discusses how the research question no. 3 was investigated through examining
10 the relationship between the chosen HEIs percentage of outputs in Q1 journals and
11 percentage of 4* publications. HEFCE advised the HEIs that the evaluation is primarily based
12 on ‘originality, significance and rigour’ of the output. However, in its entirety, the evaluation
13 framework becomes a subjective decision of the evaluator. A potential method to recognise
14 quality of an output is to observe the quality or rank of its journal based on the journal impact
15 factor.

1

Table 2. Journal article and 4* statistics of five UoAs submitted for the REF 2014 (REF Executive Summaries)

UoA (HEIs submitted)	Total journal articles submitted (Average per HEI)	Total Q1 outputs (Average per HEI)	Average Q1%	Average 4*% profile of outputs
Clinical Medicine (24)	10986 (457.75)	10452 (435.5)	95.28	23.1
Physics (32)	5302 (165.68)	4762 (148.81)	89.68	21.3
Psy, Psych & Neuro (65)	7484 (115.13)	5560 (85.53)	59.15	25.9
Anthro & Dev Science (20)	1198 (59.9)	400 (20)	30.2	19.1
Classics (18)	345 (19.1)	6 (.33)	1.9	29.4

2

3 All the outputs submitted by multiple UK HEIs in the chosen UoAs were filtered for journal
4 article submissions and the impact rating of every article's journal was mapped using
5 Thomson Reuters' Journal Citation Reports. All the quartile 1 (Q1) articles were filtered,
6 which allowed the estimation of percentage of Q1 publications in all HEIs in the five UoAs
7 (Tables 3 to 7).

8

3 A scatter plot was employed to observe any linear relationship between percentage of 4*
4 outputs and percentage of Q1 publications in multiple UK HEIs which had submitted under
5 the five UoAs. The different plots indicate a linear relationship between the percentages of
6 Q1 publications and 4* outputs at various HEIs in the Clinical Medicine ($r=0.526/ n=24/$

1 p=0.008), Physics (r=0.496/ n=32/ p=0.004) and Psychology/Psychiatry/Neuroscience
 2 (r=0.827/ n=65/ p=0) UoAs (Figures 1 to 3). However, no relationship was found for the
 3 Classics (r=0.324/ n=18/ p=0.189) and Anthropology/Development Studies (r=0.034/ n=20/
 4 p=0.888) UoAs (Figures 4 and 5).

Figure 5. 4*% Vs Q1% of various HEIs in Classics UoA

1 Exploring further, we performed a simple linear regression for UoAs 1, 4 and 9 to investigate
2 if Q1 percentage is a good predictor of 4* percentage a HEI can achieve.

3 For UoA 1 (Clinical medicine), the ANOVA indicated model significance ($F[1, 22]=8.417,$
4 $p=.008$) and 24.4% of variance in 4* percentage can be explained by a HEI's Q1 percentage.
5 The line equation to predict 4* percentage is $y=1.332(x)+(-102.245)$ which is significant
6 ($t=2.901, p=.008$).

7 For UoA 4 (Psychology/Psychiatry/Neuroscience), the ANOVA indicated model significance
8 ($F[1, 63]=135.977, p<0$) and 67.8% of variance in 4* percentage can be explained by a
9 HEI's Q1 percentage. The line equation to predict 4* percentage is $y=0.514(x)+(-12.614)$
10 which is significant ($t=11.661, p<0$).

11 For UoA 9 (Physics), the ANOVA indicated model significance ($F[1, 30]=9.772, p=.004$)
12 and 22.1% of variance in 4* percentage can be explained by a HEI's Q1 percentage. The line
13 equation to predict 4* percentage is $y=0.302(x)+(-7.648)$ which is significant ($t=3.126,$
14 $p=.004$). For UoA 9, this test was important as an outlier could have skewed the dataset,
15 however as Figure 3 indicates, the relationship is linear at the further end of the x and y axis.

16 UoA 4 appears to have the strongest link with an r value (Pearson correlation) of 0.827,
17 although the r values are not exceptionally high in clinical medicine and physics, the scatter
18 plot explains the trend of Q1 publications scoring high in the REF. The findings indicate that
19 the outcome of judgements made on the quality of research either by peer-reviewed
20 government ranking (REF results) and metrics-based ranking (JIF) largely remain the same in
21 disciplines where journals are considered the main channels of research communication.
22 There is ample literature suggesting the relationship between expert review decisions and
23 bibliometrics [18-21]. A similar study on Italy's national research assessment exercise found
24 similar claims that in pure and natural sciences, the perspectives on quality of research is

1 either similar or superior to national research assessment exercises [22]. This study supports
2 this claim, implying that quantitative measures are capable of evaluating research quality that
3 are comparable to expert review based government research assessment [22]. Additionally,
4 such a system instils public trust in the utilisation of public funds in HEIs as performance
5 metrics are readily available for public view [23]. However, JIF has also been indicated to
6 inefficiently evaluate the quality of research and quality mercantilism in general isn't an
7 appropriate evaluation technique [20, 24-26].

8 *3.3 Can the value of a good research output inform an HEI's policies?*

9 This section discusses how the research question no. 4 was investigated. The REF's executive
10 summaries supplied complete information about various UoA's output submissions, HEIs
11 submitted, category A staff, early career researchers, average 4* and 3* percentages. This
12 assisted in calculating average submissions of each HEI, number of outputs rated 4* and 3*,
13 average submissions per staff number and average number of submissions submitted per staff
14 number rated as 4* and 3*. Category C staff's outputs were used solely to rate, however were
15 not considered for funding, thus were excluded from our analysis. The average 4* and 3*
16 submissions per staff member as mentioned in the last two columns of Table 8 inform their
17 potential contribution of performance-based funding to the HEI in the UK. For example, a
18 single staff member in the Area Studies UoA submitted 3.58 outputs out of which 0.84 and
19 1.42 outputs are rated 4* and 3* respectively. Taking these average figures it is possible to
20 predict the income generated by an average member of staff through their REF outputs.
21 Considering a hypothetical situation where an HEI's department has 5 staff members, they
22 can produce 4.2 outputs of 4* quality and 7.1 outputs of 3* quality out of the 17.9 outputs
23 they would have submitted. The value of 4* and 3* outputs in Area Studies UoA is £7505
24 and £1876 respectively, which when multiplied by the number produced 4* and 3* outputs

1 and summated gives the total funding the staff have contributed to the HEI, which in this case
 2 is £44840.6.

3 Table 8. Average submission characteristics of various UoAs

Units of Assessment	Av submissions/ HEI	% of 4*	% of 3*	Av no of 4*	Av no of 3*	Av CatA staff submitted	Av submission per staff	4* : CatA Staff	3* : CatA Staff

1

2 As the results are based on averages, HEIs can set themselves benchmarks to improve their
3 performance through internal evaluations and predicting their performance in the future
4 research assessment exercises becomes a possibility. The results inform an HEI by allowing it
5 to take strategic decisions through altering its policies in the following ways:

6 a. It informs an HEI the amount of funding an academic can bring into the department.

7 b. Predict the future income for a given department based on the number of staff.

8 c. Interdisciplinary research sits in two different departments. For example, information
9 sciences either come under UoA 11 or UoA 36. As UoA 11 offers higher income for good
10 research outputs, HEIs which have submitted their information sciences research in UoA 36
11 may consider submitting in UoA 11 for the next exercise.

12 d. The results assist HEIs investment and financial strategy by informing their potential
13 income generation through performance-based research funding. For example, an HEI can
14 recruit more academics in the Engineering department so as to increase their chances of
15 acquiring funding. Hence, the investment decision can influence the future of science.

16 **4. Conclusion**

17 Our investigation of the REF as a case study reveals that in the UK a world leading research
18 output earns £7504 to £14,639 and an internationally excellent research output earns £1876 to
19 £3659, varying according to their areas of research, per year in a REF cycle. This answers our

1 inquiry into knowing the monetary value of a good research output and subsequent
2 disciplinary differences. Although this assigned monetary value of research output is
3 dependent on a country's budget, it has implications for the progress of science and research.

4 For example,

- 5 • The results can provide a reference to compare the monetary value of good research
6 outputs in different countries i.e. Italy's Research Quality Evaluation (VQR),
7 Netherlands's Standard Evaluation Protocols (SEP). According to HESA (2013), the
8 funding pot available for UK universities significantly reduced from 2008, which was
9 recently addressed by the Universities UK's 2015 call to increase science research
10 funding [27].
- 11 • The figures obtained through this investigation would allow the HEIs to forecast and
12 build strategies for investment in different disciplines that may have implications for
13 the progress of science and research in general.
- 14 • Additionally, this investigation can be applied by UK HEIs into their strategies of
15 submission for the next research assessment exercise. This answers our inquiry to
16 know the potential policy implications arising by extricating the monetary value of
17 good research outputs.

18 Our further investigation to observe any relationship between reputation of publication source
19 and quality of a research output revealed a linear relationship between the percentage of
20 quartile-one (Q1) journal publications and funding allocation in the Clinical Medicine,
21 Physics and Psychology/Psychiatry/Neuroscience UoAs, and no relationship was found in the
22 Classics and Anthropology/Development Studies UoAs, due to the fact that most publications
23 in the latter two disciplines are not journal articles. This partly answers our final question and
24 therefore we recommend a similar investigation into the rest of the thirty-one UoAs which

1 would offer a clearer picture, adding, the existence of academic literature either confirming
2 the relationship or refuting it [25, 28, 29].

13 **6. Contributions**

14 Both the authors contributed equally in incubating the study, literature search, secondary data
15 collection, statistical analyses, interpretation of results, auditing and preparation of the
16 manuscript.

17 **7. Funding**

18 There is no source of funding for this study.

19 **8. Transparency and data-sets**

20 The authors affirm that the manuscript is an honest, accurate, transparent account of the study
21 being reported; that no important aspects of the study have been omitted; and that any
22 discrepancies have been disclosed. The corresponding author had the final responsibility for
23 the decision to submit the manuscript for publication. The data sets are freely available from
24 the [Northumbria University’s repository](#).

25

1 **9. Ethics approval**

2 None required.

3 **10. Declaration of interests**

4 The authors declare no competing interests.
